Iontophoresis In Dental Practice

This use of iontophoresis is most useful in emergent situations, as iontophoresis results in more rapid dermal anesthesia than topical anesthetic agents. Topical anesthetic agents (e.g., lidocaine/prilocaine (EMLA) cream) take approximately 30 mins to achieve maximal effect, and are sufficient for dermal anesthesia in non-emergent situations.

Iontophoresis - Medical Clinical Policy Bulletins | Aetna

Iontophoresis and phonophoresis are intervention options therapists use to treat several different physical conditions. Physical agent modalities (PAMs) include superficial modalities such as thermotherapy and cryotherapy, and deep modalities such as ultrasound, electrical stimulation, and the application of topical medications. The two forms of topical medication application include iontophoresis and phonophoresis.
