Cevik-Demirkan A (1), Hazirođlu RM, Kirtül I. This study aimed at observing gross morphological and histological characteristics of the larynx, trachea and syrinx in Coturnix coturnix japonicum (Japanese quail). Sixteen mature quails were divided into two groups. Eight animals were stained with 0.1% methylene blue for 15 min, followed by 50% and 70% ethyl alcohol solution for gross morphological examination.

The Japanese quail (Coturnix coturnix japonica) has been extensively used in quail-chick chimera studies to investigate the development of a diverse range of cell types (1). Recently it has become increasingly used as a model system in its own right (2 , 3) because of its relatively small size, high egg productivity, low cost and significantly shorter time to maturity compared with chicken (4).
